B11303103 Hanaho Komatsu

May 28th, 2024

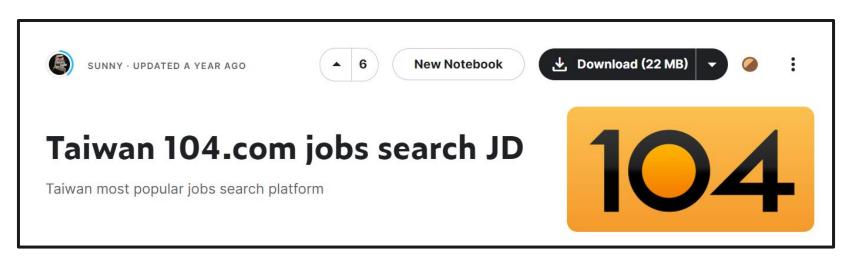

Project Background

- Difficulty of our market job searching in Taiwan
 - Limited resource in English
 - Different positions require different programming languages (like R and Python), although the job title (like "Data Analyst") is the same.

Which programming language should I specialize in to have the best prospects when job hunting?

Project Background

• Database: Taiwan 104.com jobs search result (.csv) found in kaggle

Project Background

- The dataset consists of 26,000 job listings that focuses on software-related careers from 104 Website.
- 11 Columns have been extracted for this project, which includes:
 - 職位 (Position)
 - 縣市 (City/County)
 - 地區 (District/Area)

 - 工作內容 (Job Description)
 - 工作性質 (Nature of Work)

- 需求人數 (Number of Positions)
- 學歷要求 (Educational Requirements)
- 擅長工具 (Tools Proficiency) 0
- 公司名稱 (Company Name) 員工人數 (Number of Employees)
 - 工作經歷 (Work Experience)

Project Goal

• Create a UI for Int'l students' job hunting to help them stay informed and up to the trend

Show and analyze datasets to suggest which programming language to learn/focus, as well
as determining companies that matches employee's masteries and qualifications

Methodology

Three Important Steps

- 1. Translation of the Dataset
- 2. Preparation of the Dataset
- 3. Data Visualization

Step1: Translation of the dataset

Efficient data handling using .unique() to translate every single unique data in each column

```
import pandas as pd
from googletrans import Translator, LANGUAGES

translator = Translator()
# Read the CSV file
df = pd.read_csv("career job description.csv")

# Extract the '職缺類別' column as a list of strings
county = df.地區.unique()
print(county)
type(county)
```

```
['中正區' '大同區' '中山區' '松山區' '之' '文山區' '金山區' '板橋區' '汐止區' '花」 '林口區' '五股區' '八里區' '淡水區' '蒸' '龜山區' '八德區' '大溪區' '大園區' '遠區' '南區' '南區' '中區' '南區' '西區' '大甲區' '東區' '春區' '安南區' '永康區' '歸仁' '東區' '三民區' '楠梓區' '左營區' '信' '三峽區' '蘆洲區' '五結鄉' '後龍鎮' '雲' '和美鎮' '草屯鎮' '麥寮鄉' '大林鎮' '宝' '泰山區' '宜蘭市' '頭城鎮' '冬山鄉' '仁
```

This allows Python to only translate 108 unique data instead of the entire 26,000 data individually

Step1: Translation of the dataset

The library used is the Google Translate API, but it does not work as required when translating columns with many unique names

```
# Extract the '職缺類別' column as a list of strings
county = df.地區.unique()
print(county)
type(county)
for i in range(len(county)):
    translated = translator.translate(county[i], dest="en")
    print(translated.text)
```

Shilin District
Beitou District
Neihu District
Nangang District
Wenshan District
Jinshan District
Banqiao District
Xizhi District
Shiji District

Step2: Preparation of dataset

• Unify the format in the dataset e.g. education requirement

• Filter the company according to the job vacancy and availability for each language

 Create a bar chart to visualize the most relevant programming language used in the job market

```
In [30]:
          jobs translated['Education Requirements'].value counts()
Out[30]: Education Requirements
         Above University
                                                                                  14970
         University and master's degree
                                                                                  11983
         Specialty ABove
                                                                                   9689
         College, University, Master's Degree
                                                                                   7157
         University
                                                                                   2866
         Informal
                                                                                   2746
         Above a master's degree
                                                                                   2713
         College, university
                                                                                   2705

STEP3: Data Visualization Using "Shiny for python"

- Purpose: A framework designed to create interactive web applications for data visualization and analysis.
- Components:
 - UI (User Interface): Defines the layout and look of the application.
 - Server: Contains the logic to handle user input and update outputs.
 - App: Combines the UI and server into a single Shiny app object.
- Basic Structure:
 - Define the UI using layout functions.
 - Implement server logic with reactive functions that update outputs based on inputs.
 - Create the app by combining the UI and server

Demonstration

https://faustourrutiareyes.github.io/104-jobs-dashboard/

Conclusion

Further Implementing 1

- Real Time Update of the dataset using Python Crawler \rightarrow More reliable data analysis
 - Use "requests" or "selenium" to interact with website
 - o Increase sources e.g. 1111.com, FB, linkedin and etc.
 - Improve data preparation

Further Implementing 2

- Smooth application from the app
 - Link the url of the job vacancy post to our app
 - Autofill of personal information
 - o etc

Thank you!
